

Part I: Browser and Code

Part II: Understanding

To begin with, the first videos gave me a clear understanding of how Vue works and how powerful it is for building interactive web pages. I learned how to create a basic Vue app, connect data to the page, and see it updated instantly without needing to reload. The process of mounting the app and displaying data using moustache syntax helped me realise how Vue smoothly bridges the gap between JavaScript and HTML. Seeing how everything in the app reacts automatically to data changes was interesting, making development much simpler and cleaner.

Furthermore, the second video shows me that I learned how Vue can connect data directly to HTML attributes through attribute binding, allowing images or links to update whenever the data changes. This made me understand the importance of reactivity and how it keeps everything synchronised in real time.

Lastly, the third video, which teaches conditional rendering, showed me how Vue can change what appears on the page based on certain conditions, such as whether a product is in stock. These lessons helped me appreciate how flexible and dynamic Vue can make a website feel.
